■ External Output Trimming

In order to trim the voltage up or down, one needs to connect the trim resistor either between the trim pin and -Vout for trim_up or between trim pin and +Vout for trim_down. The output voltage trim range is -10% to +10%. This is shown in Figures 1 and 2:

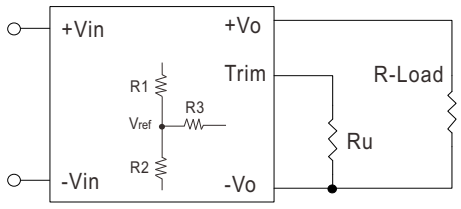

Figure 1. Trim_up Voltage Setup

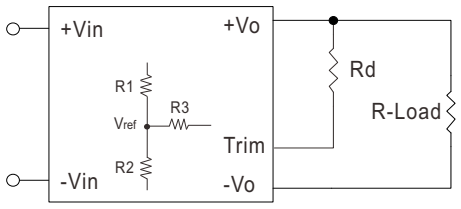

Figure 2. Trim_down Voltage Setup

1. The value of Rtrim_up defined as:

$$A = \frac{V_{ref}}{V_o' - V_{ref}} \times R1$$

$$R_{trim_up} = \frac{AR2}{R2-A} - R3$$

For example, to trim_up the output voltage of 12V module (RQB150W3-110S12) by 10% to 13.2V, R_{trim_up} is calculated as follows:

$V_{o,nom}$ = 12V
V_o' = 13.2V
V_{ref} = 2.5V
R1 = 38KΩ
R2 = 10 KΩ
R3 = 68KΩ

$$A = \frac{V_{ref}}{V_o' - V_{ref}} \times R1$$

$$= \frac{2.5}{13.2 - 2.5} \times 38 = 8.878$$

$$R_{trim_up} = \frac{AR2}{R2-A} - R3$$

$$= \frac{8.878 \times 10}{10 - 8.878} - 68$$

$$= 11.126K\Omega$$

Table 1 – Trim_up and Trim_down Resistor Values

Model Number	Vo,nom (V)	Vref (V)	R1 (KΩ)	R2 (KΩ)	R3 (KΩ)
RQB150W3-110S12	12	2.5	38	10	68
RQB150W3-110S24	24	2.5	86	10	76.8
RQB150W3-110S48	48	2.5	182	10	80.6
RQB150W3-110S54	54	2.5	206.1	10	82

Note:
1.R_{trim_up}, R_{trim_down} is mean trim resistor, please check the formula.
2.A & B: user define parameter, no actual meanings.
3.Vo′ is target trim voltage.
4.Value for R1, R2, R3 and Vref refer to above table.

2. The value of Rtrim_down defined as:

$$A = \frac{V_o' - V_{ref}}{V_{ref}} \times R2$$

$$R_{trim_down} = \frac{AR1}{R1-A} - R3$$

For example, to trim_down the output voltage of 12V module (RQB150W3-110S12) by 10% to 10.8V, R_{trim_down} is calculated as follows:

$V_{o,nom}$ = 12V
V_o' = 10.8V
V_{ref} = 2.5V
R1 = 38 KΩ
R2 = 10 KΩ
R3 = 68 KΩ

$$A = \frac{V_o' - V_{ref}}{V_{ref}} \times R2$$

$$= \frac{10.8 - 2.5}{2.5} \times 10 = 3.32 \times 10 = 33.2$$

$$R_{trim_down} = \frac{AR1}{R1-A} - R3$$

$$= \frac{33.2 \times 38}{38 - 33.2} - 68$$

$$= 194.83K\Omega$$

Hold-up Time

During the transition of different power source, the electric power on the train become unstable in a short time. Such as a sudden voltage drop or a short-term power failure. Under this situation, hold-up time circuit is suitable for this situation.

As Figure 3 shows, hold-up time circuit comprises R1, D1 and Chold. The capacity of Chold decides the hold-up time during interruption of input power.

And Figure 4 shows the table for Chold with different input voltage. For example, if input voltage is 110V, and output load is full load. The Chold need 470μF for hold-up 10ms.

During start up, R1 endures a high pulse power, and should be selected carefully. The power is related to Vbus and Chold. We recommend to use 25Ω/10W resistor.

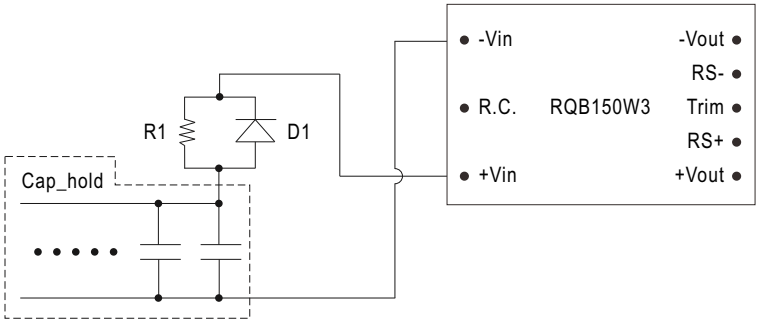

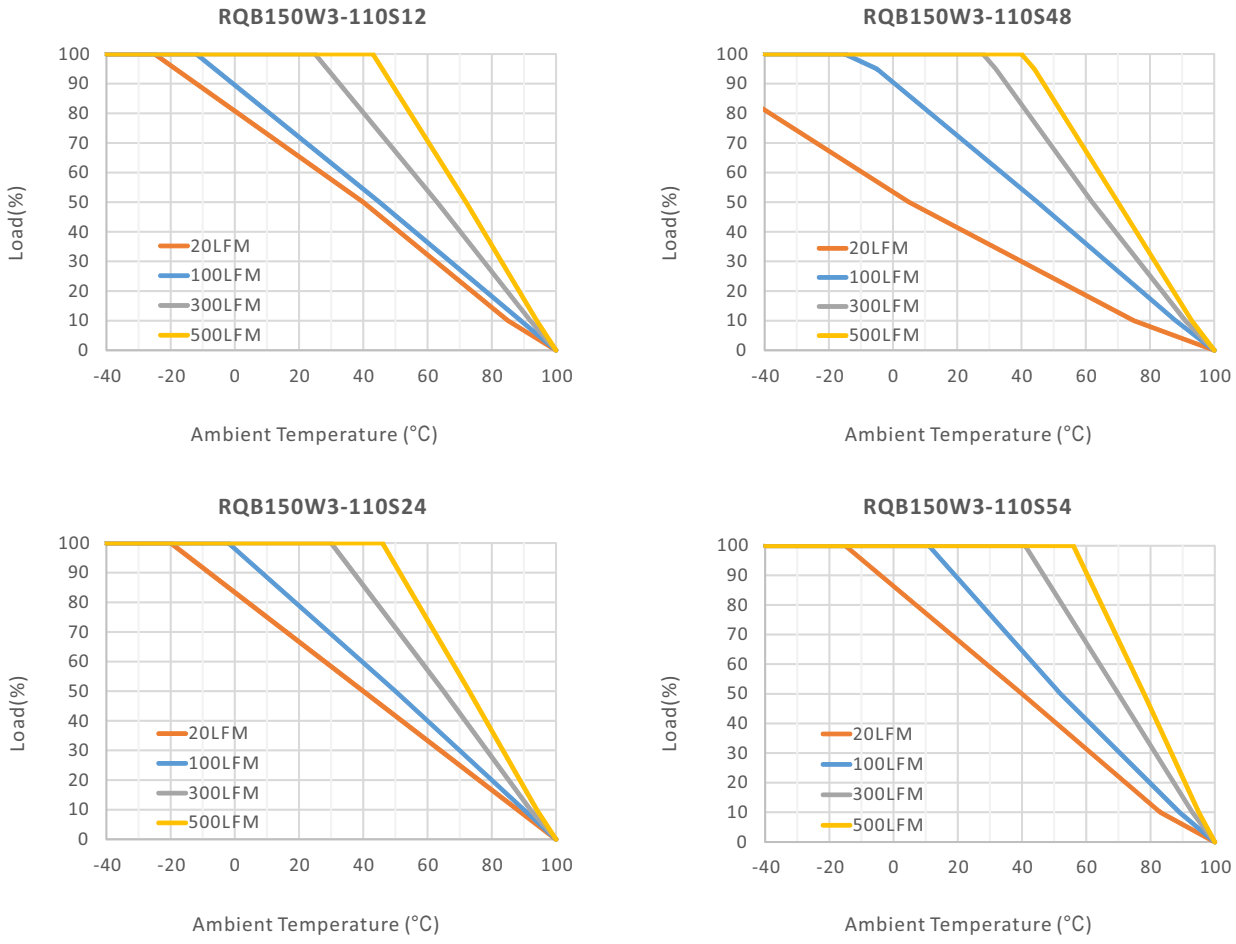

Figure 3 Hold-Up Time Circuit

Table 2 – Cap_hold table (Hold up time)

Nominal Vin	96V	110V
10ms(S2)	680μF	470μF
20ms(S3)	1200μF	820μF
30ms(C2)	1800μF	1200μF

Derating Curve

Note 1. The de-rating curve was measured at 110Vdc input with natural convection.

Note 2. In order to meet higher "derating curve" requirements, the heat dissipation can be increased by increasing the air flow (LFM) to meet the requirements.

The recommended thermal resistance formula is as follows：

Distribuída no Brasil pela LRI | vendas@lri.com.br | 51 2129-3000

The derating curve of the converter's output load with the ambient temperature. Above derating curve shows the operating ambient temperature range is from -40°C to 100°C. The output load should derating when ambient temperature over -25°C. And the environmental convection is below 20LFM.
When the ambient temperature over -25°C, RQB150W3 should derating to certain load. For example, if the ambient temperature is about 45°C, the RQB150W3 output load should derating to 50% of full load.
The thermal resistor can be calculated by below formula. Take RQB150W3 as an example, which operating at nominal voltage and output load at full load. And the power dissipation (Pd)

$$Pd = Pin - Po = \frac{Po(1-eff)}{eff}$$

Pd = 12*12.5*(1-0.87)/0.87 = 22.4W
So, the power dissipation (Pd) is about 22.4W at ambient temperature 0°C. The thermal resistance (Rca) from case to ambience is 5.75°C/W).
The maximum case temperature rise is ΔT = Pd * Rca = 22.4W * 5.75 (°C/W) = 128.8°C
The maximum case temperature is Ta = Tc - ΔT = 105°C -128.8°C = -23.8°C
So, the Ta for full load is around -25°C

Power Derating Curve

Power module can operate in variety of thermal environments. However, sufficient cooling should be provided to ensure the reliable operation of the unit. Heat can be removed by conduction, convection, and radiation to the surrounding environment.
Figure 4 is the PCB layout, which to measure RQB150W3 thermal performed, the dimension is **137 * 88 * 1.6mm, 2 OZ**. There copper can help RQB150W3 to conduct heat through the body to the PCB.
